Exos Aerospace × National Space Transportation Policy

Alignment brief — the "Golden Age of Space Transportation" policy and why it accrues to Exos | Aug 21, 2026 | Proprietary / Unclassified · Series A data room

The policy, in brief

- Updated U.S. National Space Transportation Policy (Aug 2026), building on the 2025 "Enabling Competition in the Commercial Space Industry" executive order.
- Target: **1,000+ launches *and reentries* per year on U.S. soil by 2030** — roughly a 10x expansion of today's cadence.
- DOT/FAA to cut spaceport-construction red tape, streamline launch/reentry licensing at scale (further reworking Part 450), and stand up senior space roles; integrate space traffic with air traffic control.
- Enable **launch within 48 hours** of high-priority civil and national-security missions.
- Greater commercial involvement in Moon/Mars; stronger emphasis on **exporting American capabilities**; develop additional launch and reentry/landing sites.
- Implementation depends on existing law and Congressional funding — a multi-year tailwind, not an overnight reset.

Why it accrues to Exos

Policy pillar	Exos capability & proof point
1,000 launches **and reentries**/yr by 2030 — reentry is the underserved half	Reusable + **recoverable** platform: every Exos flight is a launch *and* a reentry. Few operators compete on recoverable reentry at cadence — a defensible position on the policy's hardest goal.
48-hour responsive launch for high-priority missions	**Project Karmen** — USAF-funded demonstration of 2 flights in 48 hours on BLK3. A direct proof point.
Spaceport / reentry-site build-out; streamlined Part 450 portfolio licensing	Minimal-infrastructure model (pad + power/comms via a mobile command module) makes new sites cheap to stand up; portfolio licensing rewards cadence and multi-site ops (West Texas plays). One of only three FAA-licensed reusable rocket launch providers in the US.
Commercial Moon/Mars	Scorpius Type-5 linerless composite cryogenic tanks (TRL 9, flown on Intuitive Machines lunar missions) and in-space refueling/cryo management — enabling infrastructure for lunar/Mars logistics.
Export American capabilities	International wet-lease and trade-zone posture (Japan, Australia) — ITAR-compliant export of U.S. flight-test/launch services.

Capital-strategy tie-in

The policy is a **federal demand-pull signal** that strengthens Exos's capital pathway: it reinforces the DPA Title III and Office of Strategic Capital cases (national-priority industrial base for reusable launch, reentry, and spaceports), supports the AEDC flight-test-range positioning, and provides a market-timing catalyst for the public-listing/roll-up narrative.

> **Investor headline:** a national policy targeting **1,000+ launches and reentries per year by 2030** sizes the market Exos is built to serve — reusable, recoverable, responsive flight — and points federal capital (Title III / OSC) at exactly the capability Exos provides.

Directional; reflects public policy reporting as of Aug 21, 2026 and Exos program status. RDRE is hosted/flight-tested by Exos, not self-developed; BLK3 is FAA-licensed (Mar 2026), not yet flown commercially. Proprietary / Unclassified. Not investment advice.
