Exos Shop — Receiving & Inventory Quick Start

Mission Control on the bench iPad. Every part tracked from the PO to the build.

1 · Open Mission Control

On the iPad, open the browser → **mc.exosaero.space** → log in.

2 · Receive a delivery — tap ■ Receiving

• Pick the **QuickBooks PO** (search by PO # or vendor).

• Search the BOM and tap each part received; set **Qty**, **Unit $** (from the packing slip), and **Location** (the bin).

• Tap **Check in received parts.** Inventory on-hand, location, and cost update automatically.

3 · Photograph the part (as-built)

Open the build task → **Documents** → ■ **Take Photo** → **this task**. Shoot the component; the photo lands on that task.

4 · Check inventory — tap ■ Inventory

See on-hand, location, and what's **short** (red). Use search or the section filter. ■ **Legend** explains the colors; ■ **Locations map** shows the bins.

5 · Use parts in a build

When you install or use a part, record it as **consumed** against the job so stock and cost stay correct. Ask @**exo** if unsure.

Tips:

- Re-photographing a part that's already logged just adds the photo — it won't change the count.
- Need a login or access code? It's in the Vault: **vault.exosaero.space**.
- Questions → @**exo** in Mission Control.
