EXOS AEROSPACE

AI-Native Industrial Power · Integrated Pressurized Structures on moon-proven Type-V tanks — make every space vehicle reusable

Confidential Investor One-Pager · 2026-09-19 · Proprietary — Unclassified · Not an offer of securities

The one thing no one else has

Exos integrates the linerless Type-V composite tank — TRL-9 and space-proven on the Moon — supplied by its partner Scorpius Space Launch Company (SSLC). SSLC Type-5 tanks flew as the fuel and LOX tanks on Intuitive Machines' Odysseus and Athena lunar landers, and are the baseline for IM's Nebula orbital-transfer vehicle. Low part-count, robotically made, plug-and-play, highly reusable. Exos is the sales channel for partner SSLC's Type-V tanks (15% commission at SSLC's own price, no markup; the same 15% applies to tanks Exos buys) and holds 18% passive equity in SSLC.

The market

Composite space tanks are a **~$750M market today growing toward ~$4B/year** as lunar outposts, in-space refueling, orbital-transfer vehicles, and commercial space stations scale. Primes build internally and are not TRL-9 tank specialists; the customers — Axiom (~$525M raised in 2026), Vast (~$1B backed), Intuitive Machines ($4.1B backlog), Loft, Momentus — need an **independent** supplier who can deliver flight-grade tanks in **90 days, not two years, at roughly half the cost.**

The three-phase product story

— 1 — Tanks. Integrating SSLC's moon-proven Type-V tanks into IPS, and selling SSLC tank hardware as its channel (15% commission at SSLC's price; effective 15% rebate on tanks Exos buys).

— **2 — Tanks + engines.** Integrated propulsion structures — pressure structures plus the RDRE detonation-engine path (USAF Phase II; NASA MSFC).

— **3 — Launch services.** The reusable BLK3/BLK4 platform — flight-proven heritage (SARGE: 4 flights, 3 recoveries) that de-risks and pulls the tank + engine business through.

Why now — and why us

— **Flight-proven team, two decades deep** (Armadillo/Carmack lineage; reused a suborbital vehicle 3×) — one of only three FAA-licensed reusable rocket launch providers in the U.S.

— **Real government pull:** USAF hypersonic + DoD RDRE programs; prime on the ~$2.6B AEDC Velocity Alliance; Congressional Commission on the Future of the Navy hosted at our facility.

— An AI-native operating platform (Mission Control) that runs the company and integrates each consortium partner fast — public-grade cadence without a public-company G&A stack.

— **Timing:** defense and aerospace are the two hot capital sectors; the SpaceX moment reset the market. This window may not be here in six months.

The play & the ask

Build the U.S. composite/tank consortium around partner SSLC's Type-V tanks (supply + sales channel) and selective bolt-ons, and go public via a pipe→reverse-takeover onto NASDAQ — ~$75M total ($15M pre-merger pipe + ~$60M on-market) — sized so the company doesn't need to return to market as revenue ramps to a lunar-outpost / space-data-center inflection. Founder control preserved via a managed block; a clean, revenue-having listed vehicle; upside from TRL-9 moon-heritage tank access via SSLC, the 18% SSLC stake, and the SSLC commission channel.

Confidential — for the named recipient only. Prepared by Exos Aerospace Systems & Technologies, Inc. (John Quinn, Cofounder & CEO, jquinn@exosaero.com). Figures are working assumptions / figures of record (409A 3/31/26: $169.7M equity, $8.66/sh). Positioning held to TRL-9 / moon-proven; no first/only absolutes. Not an offer to sell or a solicitation to buy any security; any offering is made only through definitive documents and subject to due diligence and applicable securities, export-control, and CFIUS law.
