Make Every Space Vehicle Reusable

Exos Aerospace — Massive Transformative Purpose one-pager · revised 2026-10-06

Massive Transformative Purpose

Exos Aerospace exists to make every space vehicle reusable. True reusability requires more than recovering a vehicle — it requires structures and fluid-management systems that repeatedly withstand cryogenic temperatures, pressure cycles, launch loads, long-duration storage, refueling, and operations beyond Earth. Exos provides that enabling foundation through Integrated Pressurized Structures (IPS) — lightweight systems combining pressure vessels, propellant storage, and load-bearing architecture into a simpler, more capable vehicle platform.

IPS — the enabling foundation

Exos's IPS platform integrates Moon-proven, TRL 9 Type V composite cryogenic tanks supplied by our partner Scorpius Space Launch Company (SSLC) — technology that overcame the microcracking historically limiting repeated composite use in cryogenic environments. Exos buys these tanks from SSLC and integrates them into vehicles and structures. Applications: repeated cryogenic loading/reuse; long-duration cryo propellant storage; zero-loss cryo transfer; in-space refueling/depots; reusable launch & reentry vehicles; orbital transfer vehicles; lunar spacecraft/surface systems. SSLC's tanks are the baseline for the Nebula OTV tank set. Exos is not "another conventional launch provider" — it provides the foundation that lets launch providers, OTVs, and other spacecraft become lighter, simpler, refillable, and genuinely reusable.

Scorpius (SSLC) — tank supply partner and sales channel

Exos is the sales channel for SSLC Type-V tank hardware — especially internationally and through the Exos Consortium. Customers pay the same price SSLC quotes directly; Exos earns a 15% sales commission. The commission also applies to SSLC tanks Exos buys for its own vehicles, effectively a 15% rebate on the tanks Exos integrates. Exos also holds an 18% passive equity stake in SSLC.

Zero-loss cryogenic propellant transfer

With Princeton Cryogenics and David Money — demonstrating transfer between tanks without boiloff/venting loss. Combined with IPS, this enables in-space refueling, orbital depots, tank-to-tank transfer, reusable OTVs, lunar logistics, long-duration cryo missions, and spacecraft servicing.

Reusable launch as a real-world demonstration

Exos reusable launch vehicles demonstrate IPS under real flight conditions. Integration → fewer than 3,000 parts (less complexity, fewer failure points, fast turnaround). The BLK3 vehicle is FAA-licensed, with its first commercial flight targeted for early 2027. Reusable launch gives Exos revenue, a repeatable qualification environment, operational data, a cryo-transfer demonstration platform, a customer-payload platform, and a validation pathway for orbital/deep-space vehicles. Orbital (BLK4) is a funded-future path: pursued when customer, mission, and funding justify it — not by spending hundreds of millions (especially debt) to build an orbital vehicle speculatively.

The Exos Consortium

A consortium of specialized aerospace/advanced-manufacturing companies operating as an integrated industrial platform. Tools: JVs, technology licensing, long-term supply and sales-channel agreements, exclusive/preferred manufacturing relationships, shared engineering/sales/production, and selective acquisitions. Goal: place underutilized U.S. manufacturing under long-term high-volume contracts, toward highly automated lights-out production (~16 hrs/day) — expanding capacity without unnecessary ownership, capital, or operational risk.

AI-native operating platform

Built AI-native, not AI-bolted-on. Engineering, manufacturing, supply-chain, quality, flight, customer, and financial data feed a common intelligence platform → shorter cycles, earlier quality detection, per-mission improvement, utilization optimization, supply-chain resilience, and demand-capacity matching.

The Exos Opportunity — six mutually reinforcing advantages

1. Integrated Pressurized Structures built on Moon-proven, TRL 9 Type V tanks from partner SSLC (Exos: integrator, sales channel, 18% equity)
2. Zero-loss cryogenic propellant transfer (with Princeton Cryogenics)
3. Reusable launch vehicles validating the technology in real operations
4. A consortium model expanding American manufacturing capacity + recurring revenue
5. An AI-native platform driving continuous improvement
6. Industry-wide demand for lighter, refillable, cryogenic, reusable space systems

Exos is building the enabling industrial and technological platform for reusable spaceflight. Make Every Space Vehicle Reusable.
