Revised 2026-10-06 (commission-only SSLC strategy): Prior SSLC transaction and turnaround lines, and their use of funds, are removed. Scorpius Space Launch Company (SSLC) is Exos's Type-V tank supply partner and sales channel: Exos earns a 15% commission on SSLC tank hardware it sells (customers pay SSLC's own price — no markup), the same 15% applies to SSLC tanks Exos buys (an effective rebate), and Exos holds 18% passive equity. Use of funds per the commission-only model (management-prepared): $10M first close — RDRE/TACFI match $4.1M · BLK3 build/to flight $3.4M · BLK4/HVRR long-lead $1.0M · Working capital/Part 450/contingency $1.5M; $25M cumulative — RDRE $8.0M · BLK3 $3.4M · BLK4 $9.0M · WC/Part450/contingency $4.6M.

Exos Aerospace — Strategic Funding Ask

Three-tranche capital plan + integration of the Aug 20, 2026 Graham Bruce / Michael Sheldon onsite meeting (RTO roll-up path) | Proprietary / Unclassified | prepared Aug 20, 2026 — board input for Sept 8

0. Meeting integration & attribution note

Source: onsite meeting Aug 20, 2026 with **Graham Bruce** (RTO/public-markets advisor, working through **FinEx** — US SEC-registered broker-dealer — and **Cleomar**, the offshore deal-sourcing entity) and **Michael Sheldon** (senior finance/deal principal; TCW, European Technology Fund US office, ex-Merrill/First Boston, ~15 boards; joined remotely from Colorado, connection dropping — the wildfire/airport situation kept him off-site). Because a shared room mic captured both onsite speakers, **Graham Bruce's advisory statements were transcribed as "John Quinn."** In this document the advisory/RTO/deal-structuring content is credited to Graham/Michael; the Exos-specific content is Jon's.

1. Headline: run all paths in parallel

Jon's decision from the meeting, endorsed by both advisors: **pursue every capital path concurrently and discard nothing.** The meeting added a new, fast path — a NASDAQ **reverse takeover (RTO)** that creates public "acquisition currency" — that sits alongside the private Series A and the non-dilutive government capital. The strategic ask below is therefore structured as three tranches by *purpose*, each drawing from whichever source is cheapest and fastest.

2. The capital paths (sources) now on the table

Path	Instrument	Size / terms	Speed	Dilution	Role
RTO + PIPE (Graham Bruce / FinEx)	Reverse takeover into pre-funded NASDAQ shell, then PIPE	$15–20M in shell at close; +$30–40M PIPE at ~15% disc.; reverse-in valuation $150–300M (push to $500M)	~4–5 mo (vs 18-mo IPO); first cash ~4–5 wks	Founders keep 95–98% at close; ~30% = effective public control at end-state	Acquisition currency for the roll-up; fee 1% cash + 2% stock, RTO-exclusive, no retainer
Private Series A	Equity	Up to $25M; ~10–12% given up	Slower; investor controls	Yes	Primary path if kept private; matching funds "a given" with the round
OSC (Office of Strategic Capital)	Direct loan / guarantee	~$25M ask (program $10–150M); 2-yr payment-free; "senators may convert to grant"	Medium	None (debt)	Non-dilutive capex/production financing
DPA Title III	Grant / purchase commitment	~$5M avg, up to ~$200M	Medium	None	Industrial-base capacity (cryo-tank line, propulsion)
TSC SEARF + defense LOS	State grant + match	$2M SEARF + $2M defense LOS; senators	Near-term	None	Match layer — keep OUTSIDE the RTO/broker-dealer mandate

		signed; ~6 days to close			
Japan $500B fund + MDC/state site grants	Sovereign / econ-dev	State-Dept-run Japan fund; Midland Dev Corp "two sites"; Michigan model = 350 ac + $900K + facility grant	Varies	None	Facility/industrialization (explosive-rated 140k sqft) + Japan trade-zone play

Confirm — "Anigma": in your original tasking you named "anigma" as a source. Today's meeting is with **Graham Bruce / FinEx / Cleomar** and includes an "Enigma" reference (your offshore/structure discussion). Best read now: the **"Anigma" leg = this RTO / public-markets path (FinEx/Cleomar)**, not the defense-logistics startup "Enigma Aerospace" I first surfaced. Confirm and I'll lock the label. (Likewise "OSCMDB" reads as **OSC + MDC** — Office of Strategic Capital + Midland Development Corp.)

3. The three tranches — strategic amounts to ask for

TRANCHE 1 — Core build: RDRE + Reusable launch (BLK3 to flight; BLK4 funded-future) + SSLC tank channel

- **RDRE:** license-first (per Jon's model — license a target's RDRE line for ~$5M and take ~90% of commercialization) rather than build; layer USAF Phase II FA9300-25-C-6022 + TACFI 1:1 match + SEARF on top. Equity/cash need modest (~$3–5M).
- **Reusable launch — BLK4:** next-gen PSRLV build/test/FAA. Directional ~$6–10M.
- **SSLC tank channel (Scorpius):** Exos integrates SSLC Type-V tanks and sells SSLC tank hardware — especially internationally and through the Exos Consortium — at SSLC's own quoted price, earning a 15% sales commission; the same 15% applies to SSLC tanks Exos buys (effective rebate). Exos holds 18% passive equity. No capital is required from this tranche for SSLC; the Sales Commission Agreement is being drafted.
- **Indicative T1: ~$25M** (the Series A envelope) or covered by OSC ($25M non-dilutive) — RDRE/BLK4 offset by non-dilutive federal. Commission-only use of funds: RDRE $8.0M · BLK3 $3.4M · BLK4 $9.0M · WC/Part450/contingency $4.6M.

TRANCHE 2 — Vertical roll-up: JV/license + gap-filler bolt-ons (AEDC "plus four")

- **Urgency / anchor:** the **$2B AEDC Other-Transaction-Authority (OTA) initiative** — billions outside DFARs, missile-defense applications, AEDC runs it for Army/Air Force/Marine/Space Force; fractional paperwork. **Second eligibility wave opens Sept 1;** solicitations drop before year-end and the bid must be **"Exos + four"** (Exos as prime integrator with four partners/JVs), not Exos alone.
- **The set:** 7 key strategic companies (Neil knows ~half; Marcus Roofer knows the other half); ~3 wash out, 4 fit the OTA. Jon's structuring rule: license the one line you want (~$5M) rather than acquire the whole company (~$50M) where you can build the rest yourself — "22 of the technologies go commercial within ~6 months via AI-assisted design."
- **Valued gap-fillers (directional pre-diligence — ranges, not appraisals):**

Target	Fit	Profile	Est. revenue	Indicative value / entry
GTL — Gloyer-Taylor Labs (Tullahoma, TN)	RDRE + lightweight cryo composites + Nautilus LV; AFRL/DARPA, DARPA Phase II SBIR; currently raising	Small SBIR-driven; ~10% RDRE efficiency claim	low–mid single-digit $M (SBIR-led)	License RDRE line ~$5M (Jon model); or equity into their open round
CTD — Composite Technology	Resin systems used in SSLC Type-5 tanks; Type-V pressure vessels,	Founded 1988; 11–50 emp; 27k sqft; 20+	~$5–15M (headcount	~1–3× rev ⇒ ~$10–40M; strategic

Development (Lafayette, CO)	cryo, deployables — direct to the cryo-tank spine	commercial resins	heuristic)	premium (owns the resin IP under the tanks)
MATECH / Dr. Ed Pope (Westlake Village, CA)	CMC / ultra-high-temp ceramics for RDRE hot structures (chamber/nozzle/throat)	Founded 1989; ~14 people; virtual IP-licensing shop (data-broker revenue est. ~$16.5M is unreliable for this model)	thin public data — likely low $M operationally, IP-led	License/IP deal (few $M) > full acquisition; value is the patents

T2 sizing: license-first keeps cash small — roughly **$15–30M** to secure 3–4 lines/JVs for the AEDC "plus four." Full acquisitions of whole companies would run **$100M+** and are where the RTO stock currency does the work instead of cash.

TRANCHE 3 — Communications on-orbit / into space (spectrum & optical)

- **Jon's thesis (the real prize):** acquire a satellite operator ~10× Exos's size **primarily to own the FREQUENCIES/spectrum** — the scarce, appreciating asset — to support the strategic orbital-transfer-vehicle / space-station / refueling play. "Owning the frequencies to operate is where the value is." Cost to acquire a frequency-license position: **~$300–500M** (a "scenario 4" acquisition larger than Exos itself).
- **The Rocket Lab read (answers your question):** Rocket Lab acquired **Mynaric** (April 2026, ~$155.3M) — laser *optical* comms terminals, the future/inter-satellite pipes — **not licensed RF spectrum**. Jon was independently eyeing a spectrum/frequency target "two months ago and then Rocket Lab bought" into the same space. **The missed opportunity: the scarce asset is the licensed spectrum / few existing license holders, not the terminal hardware.** Optical is a supply-chain component; spectrum is the beachfront.
- **Timing window:** Jon's own view — spectrum matters for ~the next 3 years; after that optical/photonics comms reduce its value. So the frequency acquisition is a **now-window** move, made with RTO stock currency, not cash.
- **T3 sizing: $300–500M** equity/currency for the frequency-license acquisition (the "scenario 4" upside case), executed off the public vehicle rather than cash.

4. The RTO mechanics (Graham Bruce, corrected attribution)

- Reverse-merge into a clean, pre-funded NASDAQ shell (board-approved before close; unregistered non-voting preferred, converting on shareholder vote — NASDAQ Rule 5635 20% workaround). Day after close: founders own **95–98%**; the entity becomes Exos (e.g., "Exos Aerospace Holdings").
- **Timeline:** ~30–45 days to first $15–20M; PIPE begins ~week 11; larger raise closes by the shareholder vote (~4–5 months total).
- **Why Exos qualifies:** defense + aerospace are the two hottest public sectors; SpaceX/Blue Origin have no spare launch capacity → "the SpaceX for everyone else" roll-up story; deep mgmt bench + IP; Nov 2026 IM lunar-lander launch carrying partner SSLC's tanks = a public catalyst.
- **Vetting:** advisors' board in ~2 weeks screened 1,158 companies → 45 DD → 11 → **4 viable, Exos is one of the four.** Their lawyers have done ~15 RTOs in 18 months.
- **Fee:** 1% enterprise value cash + 2% stock; RTO-exclusive mandate; M&A advisory optional/separate; TSC/OSC/Title III explicitly kept outside the broker-dealer mandate.

Time-critical actions

- **By EOD tomorrow (Aug 21):** Jon to send Graham/Michael the **three scenarios** (base defense-contracts case; roll-up with ~$75–100M revenue acquired; the satellite/frequency "scenario 4"). They model dilution/cap-table next week. *I can build these three scenarios from the tranche numbers above — say the word.*
- **~6 days:** TSC SEARF $2M + $2M defense LOS expected to close (senators signed).
- **Sept 1:** AEDC $2B OTA second eligibility wave — need the "Exos + four" partner set locked.
- **Sept 8:** Exos board meeting — this document is the input.

5. Open items to confirm

- **"Anigma" = the RTO/FinEx path?** (vs. Enigma Aerospace) — confirm so I label the source correctly. Same for "OSCMDB" = OSC + Midland Dev Corp.
- **SSLC Sales Commission Agreement** — confirm final terms (15%, SSLC-price parity, applies to SSLC sales to Exos) once drafted.
- **The 7 targets by name** (Neil's half + Marcus Roofer's half) so I can value each and slot the "plus four" for AEDC.
- **The frequency/satellite target(s)** Jon has in mind (the "HughesNet-type" holder) for T3.

6. People (new dossiers)

- **Graham Bruce** — RTO/public-markets advisor; British; works via FinEx (SEC broker-dealer; Lauren = CEO; Raquel = registered rep) and Cleomar (offshore deal-sourcer, owned by his spouse). Structures NASDAQ reverse takeovers; onsite Aug 20.
- **Michael Sheldon** — senior finance principal; ex-TCW ($500B West Coast manager), built US office of the European Technology Fund (~$70M deployed), ex-chairman/CEO Portero (sold pre-2008), co-founder of a commodities investment bank/PE, ex-Merrill Lynch / First Boston, ~15 boards, engineering degree; deep tech-sector investing. Remote (Colorado) for this meeting.

Exos Aerospace Systems & Technologies, Inc. — Proprietary / Unclassified. Program figures are directional and reflect the Aug 20 meeting + public program data; not investment advice; confirm current terms before filing. RDRE is hosted / flight-tested by Exos, not self-developed (hardware path is a trade-study down-select); BLK3 is FAA-licensed (Mar 2026), not yet flown commercially; Exos is one of only three FAA-licensed reusable rocket launch providers in the US.
