6. Review and Updates

SOP-MNTN

1. Purpose

This Standard Operating Procedure (SOP) defines the maintenance policies, procedures, and techniques required to manage vendors, tools, and devices within the security boundary of the organization. It includes Microsoft Intune and Windows devices. This SOP ensures compliance with NIST 800-171, CMMC Level 2, and internal security policies.

2. Scope

This SOP applies to all systems, applications, and devices managed by the organization that handle Controlled Unclassified Information (CUI).

3. Tooling and Techniques for Secure and Compliant Maintenance

Device Management and Security Policy Enforcement

- All devices are enrolled in Microsoft Intune.
- Role-Based Access Control (RBAC) from Microsoft Entra ID ensures that only designated security personnel can modify security settings.

Firmware and BIOS Updates

- BIOS and firmware updates should be reviewed and tested before deployment.

Operating System and Endpoint Security

- Devices have automated updates for the Operating Systems – Windows.
- Applied regularly to mitigate security vulnerabilities.

Access Control and Privileged Access Management

- Local administrative access is restricted to authorized security personnel and users with a demonstrated operational need via a dedicated Entra ID admin account.
- Audit logging enables us to track administrative access and detect anomalies.

Security Admin strictly uses attended access for all remote maintenance sessions. The tooling requires MFA for the *Security Admin* to log in and a one-time code from the end-user to initiate and authorize each session; the end-user must be present throughout.

Documentation

-

Documentation and vendor and internal reference guides can be used to perform maintenance on the systems.

4. Request and Perform System Maintenance

a. Hardware Maintenance

i. The user reports an issue with the hardware to the *Security Admin*

ii. The user does not remove the internal removable digital storage media unless directed by the *Security Admin* for maintenance purposes.

iii. The *Security Admin* works with the user to fix the issue after following the approval process if there are any changes that need to be made.

iv. If the issue needs maintenance from the vendor, the *Security Admin* always supervises the maintenance sessions.

v. Non-local maintenance is performed in supervision of the *Security Admin*. Remote sessions are attended access only and require end-user authorization to begin.

b. Software and Firmware Maintenance

i. The *Security Admin* checks for firmware updates from the vendor websites every quarter and treats them as vulnerabilities or flaws and follows the **SOP-VLNSCNREM** to perform maintenance

c. After the maintenance is complete, the *Security Admin* will update the Hardware Inventory as required. *Company Admin* is responsible for returning the device to the user.

5. Change Management

All system or policy changes must be reviewed by *Compliance Admin*, *Security Admin*, or *Company Admin*.

- Change requests must be logged in the Compliance Portal
- Security impact analysis should be conducted before implementing any OS or firmware updates.

6. Review and Updates

- This SOP will be reviewed annually or when significant changes occur in the organization's maintenance practices.
