EXOS AEROSPACE

SYSTEMS AND TECHNOLOGIES

COMPANY OVERVIEW

EXOS Aerospace is an FAA-licensed reusable suborbital launch operator providing wet-leased flight test infrastructure for hypersonic, space, and defense applications.

With modeling tools mature and wind tunnels saturated, repeatable access to flight testing is the primary constraint.

EXOS delivers flight-proven reusable launch platforms that increase national test cadence, enable rapid iteration, and support payload recovery and operational learning.

CORE CAPABILITIES

- Reusable suborbital launch vehicle operations
- Wet lease flight test services for hypersonic and space systems
- NASA and DoD mission execution and contract performance
- Type V linerless composite pressurized structures
- Fractional parts count architectures enabling repeatable reuse
- LOX/methane propulsion systems and cryogenic integrated structures

COMPANY DATA

CAGE: 7EMY6
DUNS / UEI: 07-987-4626
PSC Codes: 1725, 1340, 2645, 1675, AR15
NAICS Codes: 336414, 336415, 541715, 927110

OPERATIONAL DIFFERENTIATORS

Cadence-Focused Infrastructure
EXOS provides operational flight platforms designed for repeatability rather than one-off launches, enabling faster campaign iteration and reduced program risk.

Wet Lease Integration Model
EXOS operates and maintains the vehicle, reducing integration burden and accelerating timelines for government and commercial payload customers.

Integrated Composite Structures
Through its ownership position in Scorpius Space Launch Company, EXOS strengthens industrial depth in Type V composite pressurized structures and scalable manufacturing capability.

RDRE-Aligned Flight Test Capability
EXOS is under contract with the U.S. Department of Defense to develop the flight vehicle for RDRE engine flight demonstration, where repeatable operations, rapid turnaround, and practical test execution are critical.

PROGRAM EXECUTION & FLIGHT HERITAGE

- Developed SARGE (Suborbital Autonomous Rocket with Guidance and Entry) from concept to flight in 12 months, demonstrating rapid design-to-flight execution and reusable suborbital capability
- Hypersonic Reusable Launch Vehicle (HRLV) development under USAF Phase II SBIR
- NASA contract performance and suborbital research mission support
- Northrop Grumman Lunar Lander Challenge - 1st place (Round 1), 2nd place (Round 2)
- Pioneering work in supersonic suborbital launch vehicles and modular vehicle architectures
- Reusable propulsion systems proven through hundreds of successful in-flight relights, enabling repeatable flight cadence
- Flight-proven reusable vehicle recovery and reflight operations
